1. Main Page

Main Page is the landing page of our website. Anyone who scrolls through the main page can have a brief understanding of what our website does and what are the services that have been offered through the website.

The main page starts with the navigation bar. The navigation bar gives direct links to all Rooms, all meals page. If the user is a logged-in user, then the username and logout links will be also available in the navigation bar. by clicking the username user can go to the user panel page. Where users can update profile info and check pending orders and booked rooms. If the user is an admin, then the admin panel page will be displayed.

After the navigation bar, there is a slider that automatically changes slides. slider is a bootstrap slider.it shows some of the featured images of the hotel.

Under the slider, there is a container that expresses a few main services that the hotel offers to the customers.

After that, there are some featured rooms available in the hotel. Featured hotels cards have images and prices and the ratings that the room has received from the previous users. by clicking each card users can directly go to the description page of the room.

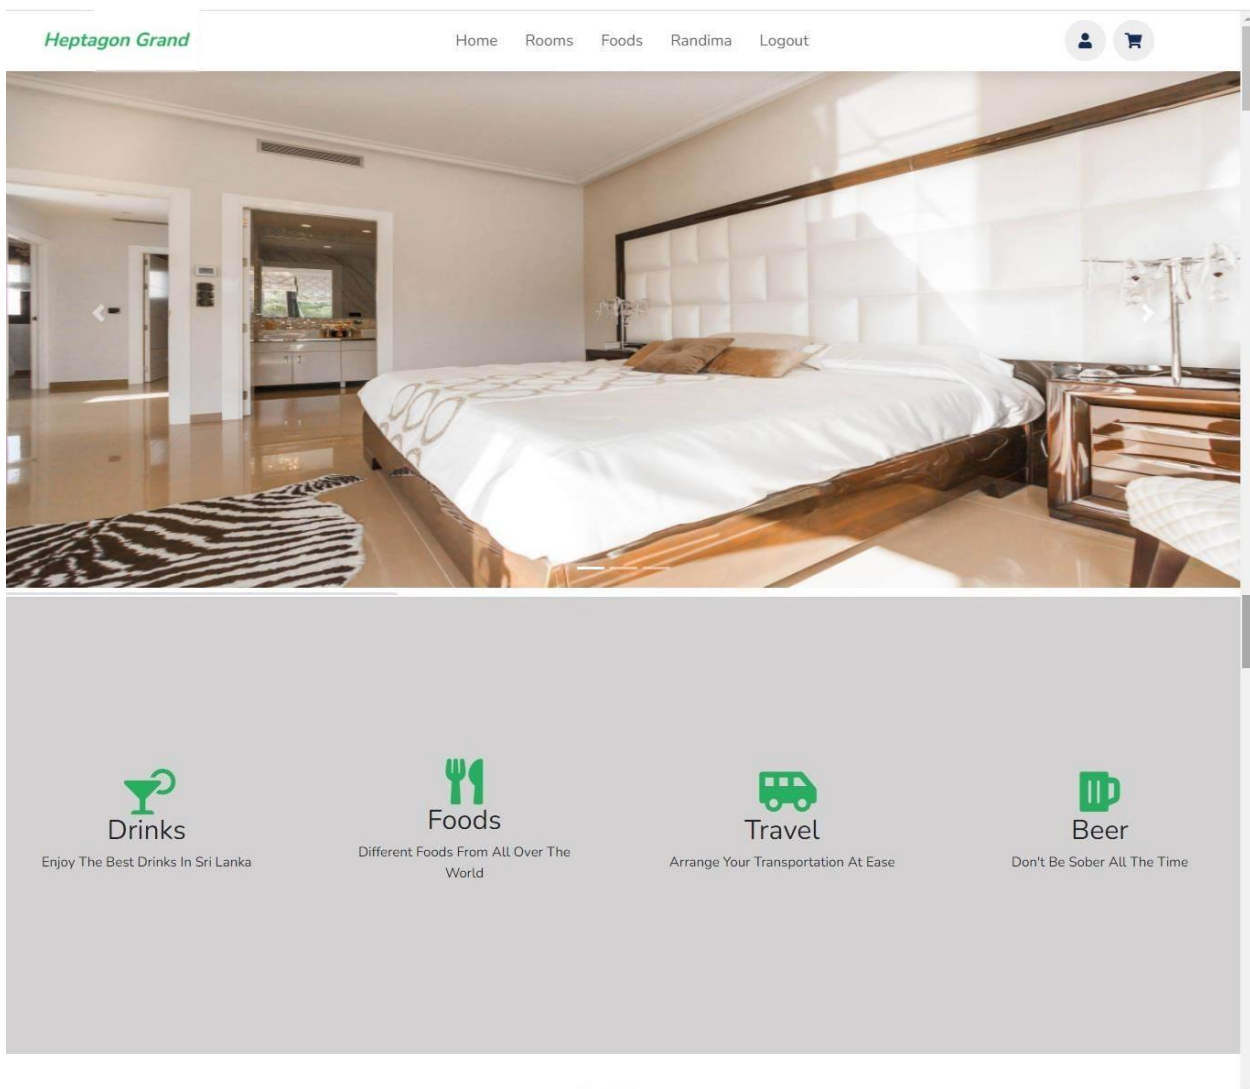

A thereafter little description about why users should choose the hotel and about the food and delivery services that the company provides.

After that special food dishes are available in the hotel. With descriptions like image, price, and ratings. By clicking each card users can navigate to the description page where they can find more details about the meals.

The main page content ends with a Contact us section. Where users can contact the hotel, we are the message.

Finally, the website ends with the footer. Which includes details about other branches of the hotel and their locations as well as quick links around the website. Also, direct links to the hotel's social media accounts.

This entire page is made out using PHP, HTML, CSS, JavaScript. The navigation bar, slider, featured rooms, special meals, and footer are also used on other pages of the website. Therefore some of the components are coded in separate pages and then included using the includes method in PHP. Therefore we were able to reuse some of the codes and styles etc.

2.Contact Page

A contact page could be a common web page on an online site for guests to contact the organization or person providing the site. The page contains Username, E-mail and message on our website, we are providing a form to contact us and share your ideas & opinions with us. And it will help to improve the progress of our website.

The screenshot shows a web page for 'Heptagon Grand'. The header includes the logo and navigation links: Home, Rooms, Foods, Randima, and Logout. There are also icons for a user profile and a shopping cart. The main content area is titled 'Contact Us' and contains a form with three input fields: 'Username' (labeled 'Enter Your Name'), 'Email' (labeled 'Enter Your Email'), and 'Message' (labeled 'Enter Your Message'). A green 'Submit' button is at the bottom of the form. The footer is divided into four columns: 'Locations' (listing India, Japan, Russia, USA, France), 'Quick Links' (listing Home, Dishes, About, Menu, Review, Order), another 'Quick Links' column (listing phone numbers +123-456-7890 and +111-222-3333, and email addresses Chasith19@Gmail.Com, Randima@Gamil.Com, and Homagama,Sri Lanka), and 'Follow Us' (listing Facebook, Twitter, Instagram, LinkedIn, and Youtube). The footer also contains a copyright notice: 'Copyright @ 2022 By Pro Sevens'.

5.All Rooms

This page starts with a navigational panel too which links to home food and log in. This is the page where the user gets to see rooms and choose a room. On this page, we have given the user the ability to filter rooms using a form container filter. User can filter price, minibar, and beds. Also, check whether bringing pets are allowed or not. Then all the rooms are displayed with a photo, rating, name, and price. At the end there is the footer, User can click on a specific box to get further information about the room. This page is created using PHP, HTML and javascript also modified with CSS.

6.Single Room

This page also starts with the navigation bar and ends with the footer. On this page at the top, we have displayed pictures of the suite. We used the slider to slide the photos and this is a bootstrap. Then we've depicted the room category, price, minibar availability, pets allowed or not, and connection availability. Then there's a space for a description of the suite. and we have shown what comes with the suite. At the end of this page, we have set a link to the book room page if the user wants to book the room. This page is also created using PHP, HTML, javascript.

8. All Meals

This page is designed to inform the user about the food details on our hotel booking page. We have allowed the users to select the food that they prefer and the price that suits them according to the dining time and under the desired category. Users can go to the icons shown by us and get all the details of the relevant food. Html, CSS, and mainly PHP were used to create the backend of our website.

9. Single Meal

Once the user entered one of the given food icons, we have created a separate page to show all the details contained therein. Here, the price of the selected food, whether the food is vegetable or meat, the category of the food item, the specifics of the food, etc., and also a simple description of the relevant food are included. The extra items that we have provided to users are Personalized Butlers, Tea & Coffee Makers, and Complimentary Movie Library. Users can go through Book Now to place a food order. Php, HTML, and also CSS are used to create the backend of this page.

17.Create A Meal

The simple truth is everyone eats food, and fresh recipes are always going to be needed. On our website, you can create a meal as you wish. You go through to create a meal page and select a category or you can insert a photo. And also you can get a better idea about our meals, there's a description in we create meal page. When talking about the backend, mostly use PHP, CSS, HTML, and My SQL.
